

**Below is a list of all things that should be considered on each page listed in descending order of most priority. This includes functionality and styling suggestions.**

**Note: Complete short document with design ideas to help the styling process**

### **Things to be displayed on all pages**

- What headings should be displayed on the nav-bar at top of the page?
- What exactly should the search bar do? (Mainly what you think the user should query on the page)
- What icons should be displayed on the top right corner and what functions should each icon allow you to complete?

### **Login.html Functionality**

- Forgot password function that allows users to direct to their email where they can change passwords on their own or do you prefer a password change request where we can assign passwords and update ourselves.

### **Styling and Design**

- What size should the window be for the login and what type of background? (You can see the resources for design ideas)

### **Dashboard.html Functionality**

- The production summary button is the only option to navigate to the production summary page. Where else would you like another option of being able to navigate to the production summary page. You can consider the nav-bar.
- Clarification on what information is represented on the map
  - Do the markers represent alarms? If so, should the markers themselves should colour with alarm priority? Are you only focusing on off or on alarms? In this case, it might be better to consider showing critical alarms so the user is not bombarded.
  - Should the markers reflect active and inactive wells as opposed to alarms?

### **Styling and Design**

- Colours of cards
- Arrangement of information on each card (See resources for ideas)

### **Production\_summary.html Functionality**

- Clarification on the "Action" button in the inactive wells card. What action should be taken and are all actions stored for later access?

### **Styling and Design**

- Colours for cards

### **Field-level-view.html Functionality**

- How should alarms be treated on this page? Should the info button in alarms provide a pop up with a short description with the option of redirecting to another page or should it redirect to the alarms page immediately?

**Dynacard.html**  
**Functionality**

- How detailed should the well bore schematic be? Maybe we can consider a static version until the page is complete.
- The “leave a comment” box should provide what information and where is this info stored? What is its usefulness?

**Edit\_well.html**

- This page mainly needs attention on the styling.
